

Rillsoft Integration Server

This solution relies on the centralised and automatic administrating of project data in a so-called repository. It's a central data base, which can be accessed via a SOAP-based service interface, as provided by Rillsoft Project, and other applications.

The role-based control and administration of access rights constitutes another part of the Integration Server

- ▶ **Multi-tenant user management**
 - ▶ completely independent structures for organisation, users and resources
- ▶ **Differentiated access rights**
 - ▶ ensure that all project members gain access to authorised data only
- ▶ **Feedbacks**
 - ▶ working time used for processes
 - ▶ processing stages of projects
- ▶ **Audit acceptability of the system**
 - ▶ all accesses and changes are recorded
- ▶ **Inter-project connections**
 - ▶ links connecting different projects of the portfolio do not shift successors automatically, but uses negative intervals instead
- ▶ **Version control**
 - ▶ all project versions are tagged with a label indicating date and user ID and stored to make them retrievable at a later point in time.

Data base: MySQL, Oracle

Operating system: MS Windows® 2000/2003/XP/Vista/7, Linux openSUSE 10/11, CentOS 5.4, Ubuntu 10.04
